Der Stand der Libelle am heutigen Dato, war folgender:

Das Rohr nach Norden: O = 29.0, W = 29.5; O' = 25.9, W' = 32.1; $\frac{(O+O')-(W+W')}{4} = -1.425$

Das Rohr nach Süden: O = 29.2, W = 30.1; O' = 26.8, W' = 32.2; $\frac{(O+O')-(W+W')}{4} = -1.575$

Ich muß aber bemerken, daß der Alkohol in der Libelle um 12 Uhr ausgefüllt wurde, weil die Blase schon so lang war, daß man nicht mehr ablesen konnte.

Indem sich bey Gelegenheit einer Umkehrung des Rohres, der Fall ereignete, daß die Hebmaschine brach, heute aber eine Stör und Hebbewegung ~~in~~ eines Theiles im Innern des Rohres bemerkt wurde, so wurde das Rohr so lange ungestört zu lassen, für gut befunden, ~~bis nicht~~ als bis die Hebmaschine fertig, und das Rohr wieder in guten Stand gesetzt werden könne, welches am 29ten geschah, wo man fand, daß sich eine Platte, die zur Befestigung des Fadensystemes im Micrometer gehört, gelöst hatte. –

Heute beobachtete ich die partiele Sonnenfinsterniß, welche vorfiel; den Anfang konnte ich nur beynahe bestimmen, ~~und~~ weil ich einer Irrung halber, den Mond auf der, der wahren, entgegengesetzten Seite, der Sonne erwartete, und er, als ich ihn wahrnahm, beyläufig $\frac{1}{2}$ Zoll der Sonne schon verfinstert hatte, ich schätze den Fehler, der bey der Zeitbeobachtung des Anfangs statt finden kann, auf Zwey Minuten. Das Ende kann obwohl es sehr heiter, und die Sonne ausserordentlich schön zu sehen war, dennoch auf eine ~~Minute~~ Zeit Secunde zweifelhaft seyn, weil sich gerade im Moment des Verschwindens der Mondes, der heute zufällig statt findende Wind, der sich bis dahin etwas gelegt hatte, wieder erhob, und ich daher, die Schwingungen des Pendels, nicht ganz genau hören könnte, jedoch, glaube ich eher auf die Güte der Beobachtung, als auf einen dabey vorfindenden Fehler, weil ich allen Fleiß auf die – so viel es die Umstände gestatten, gute Beobachtung des Endes der Finsterniß verwandte.

Hier folgt nun die Beobachtung, die bey der Beobachtung gebrauchte Uhr, ist die Hauptobservationsuhr dieser Sternwarte, von Seyffert das Instrument – ein 3 füßiges achromatisches Fernrohr von Dollond. Die Zeiten sind so angesetzt, wie sie die Uhr gab, ohne Anbringung der Correctionen für die Fehler derselben.

Anfang: $16^h\ 1'\ 2''$ aus obigen Gründen um 2' ungefähr zu spät. (um beyläufig 2' zu spät) Daraus folgt: $(17^h\ 9'\ 39'')$

Ende: $18^h\ 18'\ 18''$ Sonnenscheibe gut, zufrieden.

Ferner folgt die Meridian Beobachtung der Sonne: Die Sonne schon partiell verdunkelt:
